

Fourth Grade Math Team Planning Agenda

At Ellison our kids are worth whatever it takes.

Our Team Norms

1. Be on time and present
2. Actively participate
3. Be prepared
4. Trust the process
5. Yours + Mine = OURS

TERM	DEFINITION	EXAMPLE
Point	An exact location in space (spot)	
Line	An endless straight path with no endpoints	
Ray	A part of a line with one endpoint	
Line Segment	A part of a line with two endpoints	
Parallel Lines	Lines that never intersect (touch) Same distance apart	
Intersecting Lines	Lines that cross or touch each other	
Perpendicular Lines	Lines that intersect (touch) to form 4 right angles	

Lines of Symmetry

A line of symmetry divides a shape into two congruent parts. Congruent means the parts are both the same size and the same shape.

Lines of symmetry can be vertical, horizontal, or diagonal.

The number of congruent sides a shape has tells you the number of lines of symmetry a shape has. A square has four congruent sides so it has four lines of symmetry.

0 lines of symmetry	1 line of symmetry	2 lines of symmetry
J	M	I

Quadrilaterals

quad means four, a polygon

<p>square</p> 	<p>Parallelogram - 2 pairs of parallel sides</p> <p>4 sides of equal length</p> <p>4 right angles</p>
<p>rectangle</p> 	<p>Parallelogram - 2 pairs of parallel sides</p> <p>2 pairs of opposite sides are equal in length</p> <p>4 right angles</p>
<p>rhombus</p> 	<p>Parallelogram - 2 pairs of parallel sides</p> <p>4 sides of equal length</p>
<p>trapezoid</p> 	<p>Only one pair of parallel sides</p>
